TITLE: Preparation of phosphorus-containing polyesters by the transesterification of dialkyl phosphonates by hydroxy compounds

SOURCE: Plasticheskiye massy, no. 7, 1983, 20-21

TOPIC TAGS: polyesters, phosphorus-containing polyesters, thermosetting polyesters, polytransesterification, transesterification, dimethyl phosphonate, diethyl phosphonate, diols, polyols, hexanediol, pentaerythritol, hydroquinone, sodium, catalyst, fire retardant, fire-retardant additives

ABSTRACT: With a view toward the development of thermosetting phosphorus-containing polyesters, a study has been made of polytransesterification between a dialkyl phosphonate and a di- or polyol to form a polyester which can subsequently be cross-linked. Dimethyl or diethyl phosphonate and hexanediol,

Card 1/3

L 10774-63

ACCESSION NR: AP3003304

pentaerythritol, 2,2-bis(chloromethyl)-1,3-propanediol, hydroquinone, or 4,4'-isopropylidenediphenol were used as starting materials. Transesterification was conducted by heating a mixture of the phosphonate, di- or polyol, and sodium metal catalyst (1/1/0 .017 molar ratio) under an inert gas, with simultaneous stripping of the liberated alcohol. Transesterification rate and polyester yield were to a great extent determined by the structure of the di- or polyol. For example, the rate was higher and initial reaction temperature lower with hexanediol and pentaerythritol than with the diphenols. The polyester yield varied from 64.8% for hydroquinone and diethyl phosphonate to 97.1% for pentaerythritol and dimethyl phosphonate. Study of the effect of such catalysts as sodium metal and potassium acetate on transesterification between dimethyl phosphonate and hexanediol transesterification showed that the initial reaction temperature was 30C lower with sodium than it was with no catalyst; the yield was 92.4% with the catalyst, as against 86.4% without it. The polyesters are resins ranging from viscous to solid, with Ubbelohde drop points of 40 to 140C¹⁵ and molecular weight up to 18,000. The polyesters are suitable as fire-retardant additives to various polymers. They can be chlorinated to form polyesters

SOURCE: Tsellyuloza i yeye proizvodnye, sbornik statey (Cellulose and its derivatives). Moscow, 1963, 37-39

TOPIC TAGS: polysaccharide, cellulose, phosphorylated polysaccharide, cellulose phosphate, phosphorylation, transesterification, fire resistance, synthetic fiber, nonflammable material

ABSTRACT: The preparation of nonflammable cellulose materials was attempted by means of transesterification using tri(β,β',β'' -chloroethyl) phosphite. By heating cellulose at 80, 110 and 130°C for 5 and 8 hours in a 35-70% benzene solution of the phosphite, a series of cellulose esters was obtained with an average P-content of about 3% and a fire resistance of 90-130 by the American standard (W. Reeves, O. McMillan, J. Guthrie, Text. Res. J., 8, 527, 1957). Using 0.35% HCl and 2% CH_3COOH as catalysts, a P-content of 4% was obtained under less rigorous conditions. The esterification rate in air was about equal to that in argon. Prolonged exposure to air causes the trivalent phosphorus of the products to change to
Card 1/2

ACCESSION NR: AT4017407

pentavalent. In addition to the P-content in the product, fire resistance depends on the nature of the prevailing bonds, the C-P bond tending to increase resistance. Orig. art. has: 2 tables.

AUTHORS: Yuldashev, A.; Gefter, Ye.L.TITLE: Process of hardening the homocondensation product of di-beta,
beta'-chloroethyl ester of vinylphosphonic acid.

SOURCE: Uzbekskiy khimicheskiy zhurnal, no.6, 1963, 71-75

TOPIC TAGS: vinylphosphonate condensate, curing, hardening, vinyl-
phosphonic acid ester, heat stability, hardness, swelling, water
absorption, monomer, linear polymer, cured polymer, IR spectrum

ABSTRACT: The degree of hardening and the thermal stability and hardness of the products formed by curing the di-beta, beta'-chloroethyl ester of vinylphosphonic acid at different temperatures (at 50-1000) with different amounts of catalyst (0.2-5% benzoyl peroxide) up to 30 hours were studied. Increasing the peroxide from 0.2-0.5% increases hardness; more peroxide is deleterious to the physical-mechanical properties. If no peroxide is used, heating from 50-1000 for 30 hours produces no hardening. With the optimum 0.5% initiator, curing is

Card 1/2

ACCESSION NR: AP4010563

very rapid at first, reaching completion in about 10 hours. The product is stable to about 2300. The extent of water absorption and swelling in organic solvents and in acid and alkali was determined. Comparison of the IR spectra of the monomer, the linear polymer, and the cured polymers shows that the absorption in the cured polymer at 1620Cm^{-1} (characteristic of the vinyl group bond with a P atom) fades out, indicating the disappearance of the double bond. (The synthesis and properties of monomers). Moscow, Izd-vo Nauka, 1964, 75-79

TOPIC TAGS: organophosphorus compound, polycondensation, vinylphosphinic acid, polyester, polyamide

ABSTRACT: The purpose of this investigation was the preparation of phosphorus-containing monomers with functional groups capable of combining the reactions of polycondensation and polymerization. The investigation dealt with certain derivatives of vinylphosphinic acid, which, because of their availability, could become of practical interest. From the point of view of the synthesis of phosphorus-containing polymeric compounds (polyesters, compounds of the polyamide type), new phosphorus-containing analogs of terephthalic acid with a P-C bond were synthesized. By reacting the di-(*o*-chloroethyl) ester of vinylphosphinic acid with amino-alcohols and amino-carboxylic acids, new phosphorus-containing monomers were obtained which contain different functional groups. These functional groups

SOURCE: Zhurnal obshchey khimii, v. 35, no. 3, 1965, 590-591

TOPIC TAGS: silicon organic compound, organic synthesis, methyol group, phosphinic acid

ABSTRACT: The reaction of organoalkoxysilanes with hydroxymethylphosphinic acid, $\text{HOCH}_2\text{P}(\text{O})(\text{OH})_2$ is studied. It was found experimentally that alcohol and acid group reactions with triorganoalkoxysilanes take place at comparable rates and the main reaction product is a triorganosilyl ester of hydroxymethylphosphinic acid, which is formed with 45-55% yield as follows:

The reaction is carried out by heating a mixture of triorganoalkoxysilane with hydroxymethylphosphinic acid in a molar ratio of 3:1. The alcohol formed during the reaction is distilled off and the reaction product is then isolated. The

TITLE: Study of the polymerization ability of esters of phenylvinylphosphinic acid

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 8, no. 3, 1966, 486-489

TOPIC TAGS: phenylvinylphosphinic acid, alkyl phenylvinylphosphinate, flame resistant polymer, phosphorus containing polymer, styrene, styrene copolymer, polymerization, copolymerization

ABSTRACT: The polymerization and copolymerization ability of some esters of phenylvinylphosphinic acid (PVPA) $C_6H_5(CH_2=CH)P(O)OH$ was investigated to widen the list of phosphonates and phosphinates usable as flame retardants monomer components of plastics. The following esters were studied: ethyl-, ethylene glycol- and allyl phenylvinylphosphinates. It was found that the ethyl ester polymerizes slowly, forming only low-molecular products. Both double bonds in the symmetrically esterified ethylene glycol ester have about the same activity and three-dimensional copolymers with styrene are formed. The allyl ester polymerizes at a somewhat higher rate than the ethyl ester; it forms low molecular linear polymers. Two different double bonds in the allyl ester differ sharply: the vinyl group forms the backbone of the

Card 1/2

UDC: 66.095.26+678.86

L 21405-66

ACC NR: AP60101.13

polymer and participates in the copolymerization with styrene; the allyl group does not react and remains as a side chain. It was found that copolymers of PVPA esters with styrene, which contain more than 1% phosphorus, burn only in an open flame, while those containing more than 2% phosphorus become only charred. The temperature dependences of the mechanical deformation of copolymers of PVPA esters with styrene were determined and the results presented graphically in the original. TITLE: Reaction of aryl dichlorophosphines with cyclic oxides. XI. Syntheses of
esters of phosphorus acids and ethylene glycol by thermal selfcondensation?

SOURCE: Zhurnal obshchey khimii, v. 36, no. 1, 1966, 79-81

TOPIC TAGS: ester, phosphorus compound, ethylene glycol, condensation reaction, chemical synthesis, UV irradiation, chemical bonding

ABSTRACT: A simple method was developed for synthesizing esters of phosphorus acids and ethylene glycol by thermal self-condensation of mono-beta-chloroethyl esters of the corresponding acids at 200-240°. The structures of some of these compounds were confirmed by converting them to the corresponding acid chlorides (with PCl_5), as well as by countersyntheses. The invariance of the rate of the self-condensation reaction in the presence of initiators and inhibitors of radical processes, as well as under the influence of ultraviolet irradiation, makes a free radical mechanism of this process improbable. The authors consider a heterolytic course of the thermal self-condensation (in the polar media of the esters themselves).

L.ORG: Scientific Research Institute of Plastics (Nauchno-issledovatel'skiy institut plasticheskikh mass)TITLE: Kinetics and mechanism of homopolycondensation of di- β , β' -chloroethylphosphorous acidSOURCE: Vysokomolekulyarnyye soyedineniya, v. 8, no. 7, 1966, 1279-1282TOPIC TAGS: polycondensation, phosphorous acid, organic phosphorus compound

ABSTRACT: The kinetics of homopolycondensation of di- β , β' -chloroethylphosphorous acid were studied at 195, 200, 205, and 210°C without a solvent in a stream of dry nitrogen, and the 1,2-dichloroethane evolved (from which the extent of the reaction was calculated) was driven off continuously. The reaction was shown to be first order. Its initial stage consists of an intramolecular conversion, which proceeds via cyclic intermediates and involves a circular electron transfer in accordance with the following hypothetical mechanism:

Card 1/2

UDC: 541.64+678.86

1. 41220.60

ACC NR: AP6023433

The rate constants of the reaction were calculated, and its activation energy was found to be 15.4 ± 2.0 kcal/mole. The products, in addition to 1,2-dichloroethane, were polyester chains formed by the opening of the unstable cyclic intermediates. Orig. art. has: 3 figures.

SOURCE: Zhurnal obshchey khimii, v. 36, no. 8, 1966, 1473-1474

TOPIC TAGS: organic oxide, ester, phosphinic acid, pyridine

ABSTRACT: A new dioxide of the di(o-allylphenyl) ester of methylphosphinic acid was synthesized according by reaction of o-allylphenol with the dichloride of methylphosphinic acid and pyridine, followed by epoxidation of the di(o-allyl-phenyl) ester of methylphosphinic acid produced with excess peracetic acid. TITLE: Mechanism of thermal self condensation of mono- β -chloroethyl phosphonate

SOURCE: Zhurnal obshchey khimii, v. 36, no. 9, 1966, 1712-1713

TOPIC TAGS: chloroethyl phosphonate, thermal self condensation, condensation reaction, ester, phosphonic acid

ABSTRACT: Analysis of recent experimental data on the thermal condensation of 3-chloroethyl esters of arylphosphonous acids leads to the conclusion that the thermal condensation of β -chloroethyl phosphonate proceeds not by the previously proposed ionic mechanism (E. L. Gefter, I. A. Rogacheva, ZhOKh, 36, 79, 1966) but by the following mechanism:

Influence of an acid- or base-forming diet on the metabolism of rabbits, while at work and at rest. I. Yu. M. Hefter and K. L. Glinka-Chernorutskaya. *J. Physiol.* (U.S.S.R.) 10, 78-83 (1935).—The alkali reserve of rabbits fed on an acid-forming diet (oats, bread, bran and milk) dropped 20-25%. The alkali reserve increased with rabbits fed on a base-forming diet (vegetables and hay). The work assigned the rabbits consisted in daily running on a revolving wheel for 0.8 min. Such work was without effect on the metabolism, when an acid- or base-forming diet was used. Influence of myoinositol on the metabolism of rabbits kept on an acid- or base-forming diet. II. *Ibid.* 84-N.—The daily subcutaneous injection of 0.1 cc. of a standard myoinositol soln. into rabbits brings about a decided disturbance in their metabolism. The total N excreted increases; the NH₃ in the urine increases 2-3 times that of normal; the alkali reserve falls; the total and reduced glutathione increases. These changes are more pronounced in rabbits fed on a base-forming diet (vegetables and hay), than in rabbits fed on

an acid-forming diet (oats, bran, bread). Action of myoinositol on the blood-sugar content on an acid- or base-forming diet, at rest or at work. III. K. L. Glinka-Chernorutskaya. *Ibid.* 90-92.—A single subcutaneous injection into rabbits of a 0.1 cc. of a standard myoinositol soln. brings about a rise in the blood sugar, which reaches a max. after 3 hrs., and then gradually drops, reaching normal in about 3 days. The increase is, for rabbits on an acid-forming diet, 34 (at rest) and 21% (at work); on a base-forming diet, 54 (at rest) and 23% (at work). A single injection of 0.01 cc. of a standard myoinositol soln. brings about the opposite effect: the blood sugar decreases 19-23%, but rapidly returns to normal. II. C.

✓ Metabolic changes in tissues of rats on inadequate protein diet. O. N. Abbakumova-Zepalova, Yu. M. Getter, B. I. Glinka-Chernorutskaya, M. G. Melik-Bagdasarova, S. I. Turchenko, and B. K. Tydman-Chetverikova (1st Leningrad Med. Inst.). *Ukrain. Biokhim. Zhur.* 12, 258-65 (1930); *cl. Byull. Akad. Biol. i Med.* 27, 294 (1939). Quantitatively and qualitatively inadequate protein diet causes various metabolic disturbances affecting neuro-humoral regulation. Adequate quantity and quality of protein must be fed both healthy and sick people with protein deficiency. With 82 rats, it was found that in both liver and muscle acetone bodies increase considerably, 11-fold in liver as against the norm (35 rats), i.e. 29.2 mg % as against 2.6 mg %; in muscle a 0-fold increase (35) mg % in norm and 30.0 mg % in exp.). During protein-deficient diet the content of acetone bodies was considerably higher than during starvation, despite complete absence of carbohydrate supply, and even more strikingly shown was the decrease in glycogen during starvation. The coeff. expressing ratio of lipide I/cholesterol was 0.88 (29 rats) in the norm, which increased to 1.11 (66 rats) on a low-protein diet, i.e., is detd. by quantity of phospholipides and by simultaneous decrease in cholesterol content. The reverse phenomenon was noted during complete starvation, the ratio decreasing to 0.70, depending primarily upon phospholipides. Cholesterol fluctuations were normal. Total blood glutathione remained in the normal range, but the ratio between its various forms varied, the oxidized form increasing and the reduced form decreasing (86 exp. rats, 17 of them controls). such changes were observed during starvation. Oxidation-reduction processes did not show quant. or qual. disturbances during complete starvation. A study of various metabolic indicators in humans suffering from protein deficiency and showing hypoproteinemia (extensive burns, inflammatory osteomyelitis, and others) has shown various disturbances, (protein, carbohydrate, and other indexes of metabolic disturbances) which have an effect upon the nervous system and upon neuro-humoral regulation, by acting on nerve receptors and centers which control physiol. processes.

Significance of extensive protein diet in the treatment of
severe burns. *Khirurgija, Moskva* no. 2:25-30 Feb 1953. (CLML 24:2)

1. Of Leningrad Scientific-Research Institute of First Aid.

Daily observations of patients with severe burns of large areas of their bodies leaves no doubt that recovery is largely due to the high-calorie protein diet. Loss of protein of the blood is very marked in patients with severe burns. Biochemical examination reveals that between 4% and 5% of the contents of blisters is protein. Normally, protein constitutes 6% to 7% of the whole blood. A single blood transfusion of one liter of blood per day is not sufficient to replenish the daily loss of blood protein; the deficit must be supplemented by proper diet rich in protein. 255T21

Spectroanalytical determination of boron in steel
V. M. Stepanchuk and O. B. Pal'kova Zavod-Byuro Tch.
No. 1, 71-4 (1955). A photographic method was
developed for determining boron in steels in concns. of from 0.1 to 1%.
A spark, of which the anode was the sample and the
cathode was Arment's iron, was used as the source of the
excitation of the spectrum. The lines $\lambda\lambda = 2801.7$ Å
and $\lambda\lambda = 2810.8$ Å, were used. Standard solns. were
prepared by dissolving 1 g. of Castrol in 100 ml. of 30% HCl
to which a little concn. HNO₃ had been added. The soln.
was heated, filtered, and sufficient H₂O added to make
100 ml. The concns. were 0.1, 0.2, 0.5, and 0.8%.
The standard solns. were analyzed by placing a drop of the
soln. on the flat surface of a graphite electrode, and the
electrode dried in vacuo for 2-3 min. A graphite core in a
spark, each of the standard and the sample solns. were
photographed on the same plate. The spectrograms ob-
tained were measured in a microphotometer. Spectra of 3
standard solns. were photographed on each plate with
sample solns. The spectrograms were treated by the
method of 3 standards. The data were accurate to
within approx. 3.8% of the concn. detd. The lower limit
of the detection by this method is approx. 0.03%. The
sensitivity of the method can be increased to det. 0.1 to
0.01% of B in the sample by using filings of the sample for
the analysis. The accuracy was approx. 1.5%. The
filings were placed in the lower (All) electrode. An activated a-
iron was used as the source for the excitation of the spectrum.
The standard solns. for this detn. were prepared by "big"
steel filings. Two references. W. R. Henn

The Influence of Third Elements in the Spectrometry of Steel. N. M. Geguchashvili, T. B. Yeshivali, and N. L. Mandrikashvili. 14 pages. From *Zarodskaya Laboratoriya*, v. 12, no. 6, 1946, p. 589-594. Henry Bratcher, Altadena, Calif. (Translation No. 1942.)

Standard samples for spectrum analysis issued by the Ural Institute for Metals were studied in order to determine the effect of "third elements" on the intensities of characteristic lines. Nineteen samples were low alloy type, and the rest were high alloy or chromium nickel steels. Results of the measurements are charted and discussed in terms of the effect upon analysis for copper, vanadium, silicon, nickel, chromium, manganese, molybdenum, and tungsten.

The passage of a spark discharge. I. S. Abramov, N. M. Geguchikul, S. I. Likhina, and S. L. Mandel'shtam. *Zhur. Tekhn. Kibernetiki*, No. 17, 163-7 (1947). — The observed velocity of development of the path of a spark discharge is of the order of 1-3 km/sec, which, when considered in conjunction with well-known emitted audible shock wave, makes it probable that the passage of the spark is of an explosive character. Expts. conducted in various gases and in different geometric contours with Tepper's method and the method of reflection development confirms the shock mechanism of the development of the path of the discharge. Tepper photography shows the presence of a sharp boundary "skin" for the passage of the discharge. H. K. L.

Title : Determination of Certain Impurities in Tungsten by Spectral Methods

Orig Pub : Zavod, laboratoriya, 1955, 21, No 9, 1075-1079

Abstract : Examination of a method for spectral analysis of raw material, intermediate products, and finished articles made of tungsten containing impurities of Si, Al, Fe, Ca, and Mg in amounts from 0.001% and above; the relative error of the method is 6-8% for a single determination. The method is based on the suppression of the tungsten spectrum by creating in the excitation source conditions that contribute to difficulty-volatile compounds of this element. For this purpose, all the above materials were converted by roasting in air at 700-800° into tungsten trioxide, the powder of which was mixed with carbon powder at a ratio 1:1 and with 1% (of the weight of the carbon) of CuO. A briquette made of 50 mg of the mixture was placed in the deep crater of a carbon electrode of a dc arc. By choosing the depth of the crater, the size of the batch, and the ratio of the tungsten trioxide and carbon in the mixture, it became possible to obtain for the sample a spectrum without tungsten lines.

TITLE: News in Brief

PERIODICAL: Zavodskaya laboratoriya, 1959, Vol 25, Nr 8, pp 981-983 (USSR)

ABSTRACT: 1) The authors determined the impurities of Si, Fe, Al, Mn, Mg, Cu, Ca, Bi, Pb, Sb, and Na in thorium dioxide with a sensitivity of 10^{-2} - 10^{-4} % by burning a briquette from the sample mixed with carbon powder (3:1) in the crater of a carbon electrode type "ryumka". The spectograph ISP-22 was used. The analytical doublets are listed. 2) The author reports on the application of a photoelectric device FES-1 for the rapid analysis of open-hearth furnace slag for silicon dioxide (15-30%), calcium oxide (25-55%) and complete iron (5-15%). There is a description of the operational method. 3) The laboratoriya zavoda (Plant laboratory) applies a spectrum method for the determination of titanium impurities (of an approximately 0.01% concentration) in aluminum

Card 1/4

SOV/32-25-8-28/44

News in Brief

alleys according to a series of standard samples. A spectrograph ISP-22 and an ac arc generator PS-39 were used. 4) The author reports on a method for localized spectrum analysis of steels and welded seams for the determination of phosphorus. The distribution of P was investigated in thin layers (up to 0.02 mm) of metals and welding seams by the use of a DG-1 generator and a quartz spectrograph and the phosphorus contents of microscopic inclusions and thin coatings were investigated. 5) The author determines calcium oxide and ferrous oxide in slags of electric furnaces in which the slag sample (0.2 g) was wetted with a saturated aqueous copper sulfate solution (2 ml) subsequently dried and put in the craters of two arc carbon electrodes. Spectrograph ISP-22 and generator DG-1 were used. 6) The author analyzed magnesite and magnesitic refractory substances by mixing the sample with carbon and barium nitrate (1:2:1) and evaporating it in the crater of a carbon electrode in an ac arc. A spectrograph ISP-22 was used. The use of this method was introduced at the Plant "Magnezit", Kuznetskiy metallurgicheskiy kombinat(Kuznetsk Metallurgical Kombinat) and Zaporozhskiy zavod ogneuporov (Zaporozh'ye Plant of Refractory Materials). 7) The authors apply a spectrum method for the determination of phosphorus

Card 2/4

News in Brief

SOV/32-25-8-28/44

pentoxide in zirconium dioxide. The determination takes only 2 hours. 20 mg of the sample mixed with carbon (1:1) is put into the carbon electrode and the spectrum lines are measured with a spectrograph ISP-26. 8) The authors, working in the laboratoriya instituta (Institute Laboratory) report the preparation of standard samples from technical Ti for the determination of hydrogen by the spectrum method. The article contains a description of the preparation method and the determination results according to different methods of the hydrogen in standard samples (Table). The difference is maximum relative $\pm 13.5\%$. 9) The author reports on a simple spectrum method for the determination of small quantities of Ba and Mn in calcium chloride water of high mineral contents. He used a spectrograph ISP-22, microphotometer MF-2 and standard samples. There are 1 figure and 1 table.

TITLE: Effect which the drift of ions from a discharge has on the state of impurity ionization 21, 44, 55

SOURCE: AN SSSR. Doklady, v. 165, no. 5, 1965, 1045-1047

TOPIC TAGS: hydrogen plasma, plasma physics, spectral line, electric discharge ionization, ion density

ABSTRACT: The author considers the total number of atoms or ions contributing to the formation of a given line for calculating energy losses from a hot hydrogen plasma and also for evaluating electron temperatures from the intensity of individual spectral lines. Drift and diffusion processes are considered as well as recombination of ions on the walls of the discharge chamber. It is assumed that the number of impurity ions and atoms in the discharge remains constant and that the rate of the drift for the ions is independent of their charge. Helium, which is weakly

Card 1/2

UDC: 533.9.07

L 15170-66
ACC NR: AP6002420

adsorbed by the walls of the chamber was considered as an impurity. A system of equations is given which describes ionization of the helium with respect to ion drifts from the chamber for a uniform plasma with a given electron temperature and density. The problem is solved for the density of neutral atoms, singly charged and doubly charged ions. Curves are given showing the steady-state values of these densities as a function of ion lifetime as well as the time dependence of the various densities at different ion lifetimes. The results show that care should be taken in interpreting the data of spectral measurements for each specific experimental case. They also indicate that there is a theoretical possibility of determining the average lifetime of ions in terms of their drift from a discharge. In conclusion I am sincerely grateful to Ye. I. Dobrokhотов for discussion of this work. Orig. art. has: 3 figures, 1 table, 2 formulas.

Title : Some Data on Histochemical Investigation of Embryonic Nerve Tissue. Report 1. Deoxyribonucleic Acid.

Orig Pub : Sabochota meditsina, 1957, No. 5, 13-20.

Abstract : A study was conducted by the Feulgen reaction of DNA content in cells of the anterior brain in chick embryos on the 5th, 10th, 15th, and 20th day of incubation. On the 5-10th day, DNA changes to a granular state. The granules are arranged around the nucleolus. The histochemical changes correspond evidently to the morphological and functional specialization of cell elements of the anterior brain. -- Author's abstract.

TITLE: Production of glasses stable to the action of alkali metal vapors

SOURCE: Steklo i keramika, no. 7, 1966, 11-14

TOPIC TAGS: borate glass, aluminophosphate glass, sodium, cesium

ABSTRACT: As a result of studies of aluminoborate and aluminoborophosphate glass systems, carried out at NIIES, S50-1 glasses stable to the action of cesium vapor and S50-2 glasses stable to the action of sodium vapor were developed. The founding and processing technology worked out by NIIES has been used at the Ordzhonikidze Plant since 1963. Physicochemical and other properties of S50-1 and S50-2 glasses are reviewed. The furnaces used for founding the glasses and the schedules employed are described. The adoption of production of glasses resistant to alkali metal vapors has permitted the Moscow Electric Lamp Plant (Moskovskiy elektrolampovyy zavod) to manufacture highly economical sodium vapor illumination lamps and sodium and cesium vapor spectral lamps. "Hilbert's Boundary Problem and Singular Integral Equations for the Case of Intersecting Contours," Soobshch. AM Gruz. SSR, Vol 15, No 2, pp 69-76, 1954

The author gives the solution of the Hilbert boundary problem in the theory of analytic functions in the case when the plane of the complex variable is cut along a contour which is the finite totality of closed and open lines fulfilling two conditions imposed by the author. This is a generalization of two earlier works (Trjitzinsky, W. J., Trans. Amer. Math. Soc., 1946, 60, 167-214; and Kvæselava, D. A., Tr. Tbilis. matem. in-ta, 1949, 17, 1-27). (RzhMat, No 6, 1955)

Gegelia, T. G. On boundary values of integrals of type $1/r - F(r)$

boundary type for unsmooth surfaces

Nauk. zhurn. SSSR 15 (1954) 61-66. 6 p. 1954

The author studies in Euclidean three-space

$$(1) \quad \Phi(P) = \iint_S M(Q, P) \varphi(Q) r^{-1} dS_Q \quad (P \in S)$$

where $r = r(Q, P)$ is the distance between points P, Q ,
 S is a rectifiable surface without self-intersections,
 $M = (m_{ij})$ ($i, j = 1, \dots, n$) is a matrix, and φ is a vector on S . Under various conditions formulas of type (1) for the boundary values of integrals are of importance for the theory of singular integral equations
 for surfaces which are not closed (that is, that may have edges) see a paper of the reviewer's Acta Math. 84 (1950), 1-128; MR 12, 505, for closed surfaces of closed manifolds see, e.g., G. Guad. Ann. Sci. Ecole Norm. Sup. (3) 51 (1934), 251-372. A. V. Bicadze Izv. Akad. Nauk SSSR Ser. Mat. 17 (1953), 25-53; MR 15

533]. The author establishes a number of properties of values formulas under conditions which, among other directions are more general than those involved in earlier works. Thus, for example, S may possess certain, possibly mild forms of unsmoothness and may be subject to conditions lighter than those of Ljapounoff. In a later paper the author intends to make applications of the results obtained to a study of singular integral operators.

SUBJECT USSR/MATHEMATICS/Theory of functions CARD 1/3 PG - 717
 AUTHOR GEGELIJA T.G.
 TITLE On a generalization of a theorem of G.Giraud.
 PERIODICAL Soobshchenija Akad. Nauk Gruzinskoj SSR 16, 657-663 (1955)
 reviewed 4/1957

The author considers the principal value in the sense of Cauchy of the integral which is defined by

$$(1) \quad \psi(P) = \iint_S \frac{M(Q, P) [\varphi(Q) - \varphi(P)]}{p^2(Q, P)} dS_Q ,$$

where S is a surface without multiple lines; P, Q are points of S ; $p(P, Q)$ the distance between P and Q ; $M(P, Q)$ is a function given on S , and $\varphi(Q)$ is a continuous function being defined on S .

1. At first the author introduces the notion of the surface of the class B being defined as follows: For $P \in S$ let $\Pi(P)$ be the plane which passes through the point P , and $\Pi'(P, v)$ and $S'(P, v)$ respectively are the parts of $\Pi(P)$ and the surface S contained in the inner of the sphere $C(P, v)$. It is assumed that there exists a biunique connection between $S'(P, v)$ and a certain part $\Pi'(P, v)$ such that if $Q \in S'(P, v)$, then there exists $Q' \in \Pi'(P, v)$ such that for all $Q \in S'(P, v)$ we have

$$(2) \quad c_1 p(Q', P) \leq p(P, Q) \leq c_2 p(Q', P), \quad dS_Q \leq C d\sigma$$

Soobchenija Akad. Nauk Gruzinskoj SSR 16, 657-663

CARD 2/3 PG - 717

C, C_1, C_2, ψ being positive constants and $d\sigma$ the element of area in the point Q' of the plane $\Pi(P)$.

2. Every continuous function $\varphi(Q)$ defined on S is called function of the class T if there exists

$$\lim_{\delta \rightarrow 0} \iint_{S(P, \delta)} \frac{|\varphi(Q) - \varphi(P)|}{p^2(P, Q)} d\sigma_Q$$

uniformly for $P \in S$, where $S(P, \delta) = S \cup S'(P, \delta)$. Then the author establishes:

Theorem 1. If $\omega(\delta, \varphi)$ is the modul of continuity of φ on S and if $S \in B$ and $\varphi \in T$, then we have

$$(3) \quad \omega(\delta, \varphi) \leq C \left\{ \omega(\delta, \varphi) + \int_0^\delta \frac{\omega(\tau, \varphi)}{\tau} d\tau + \delta \int_\delta^\eta \frac{\omega(\tau, \varphi)}{\tau^2} d\tau \right\},$$

where C and η are positive constants.

Theorem 2. If $S \in B$ and $\varphi \in T$, then $\int_0^r I(\tau, \varphi) \mu(\tau) d\tau \leq C \left\{ \int_0^r I(\tau, \varphi) \mu(\tau) d\tau + \int_0^r \frac{\mu(t)}{t} dt + \int_0^r \frac{I(t, \varphi)}{t} dt \int_0^t M(t) dt + \int_r^\eta \frac{I(\tau, \varphi)}{\tau} d\tau \int_r^\eta M(t) dt \right\}$, $\int_0^r I(\tau, \varphi) d\tau$

Soobschenija Akad. Nauk Gruzinskoy SSR 16, 657-663 (1955) CARD 3/3 PG - 717

where $\mu(t)$ is an arbitrary positive and integrable function, $\tau I(\tau, \psi) = \omega(\tau, \psi)$, and C and γ positive constants.

3. Then the author studies some more special classes of continuous functions, e.g. the classes $H_\alpha \Lambda_r$ and $h_\alpha \lambda_r$ of the functions ψ being defined on S and satisfying the conditions:

$$\omega(\delta, \psi) = o(\delta^{\alpha} \lg^{-r} \frac{1}{\delta}) \text{ and } \omega(\delta, \psi) = o(\delta^{\alpha} \lg^{-r} \frac{1}{\delta}).$$

If I_r is the set of the function ψ such that

$$\int_0^r I(\tau, \psi) \lg^r \frac{1}{\tau} d\tau < \infty, \text{ then } (S \in B \text{ and } \psi \in I_0) \Rightarrow (\psi \in I) \text{ (theorem 3).}$$

The theorems 1-3 imply

Theorem 4. If $S \in B$, and ψ belongs to one of the classes $H_\alpha \Lambda_r$ ($0 < \alpha < 1$); $H_1 \Lambda_{r+1}$, $h_1 \lambda_{r+1}$ ($r < 0$); $H_1 \Lambda_{r+1}$, $h_1 \lambda_{r+1}$ ($r < 0$); Λ_{r+1} , D_{r+1} ($r > 0$); I_{r+1} ($r \geq 0$), I_∞ , where $H_0 \Lambda_r = \Lambda_r$, $h_0 \lambda_r = D_r$ ($r > 0$), then ψ being defined by (1) belongs to $H_\alpha \Lambda_r$, $h_\alpha \lambda_r$; $H_1 \Lambda_r$, $h_1 \lambda_r$; H_1 ; h_1 ; $H_0 \Lambda_r$, $h_0 \lambda_r$, I_r , $I_\infty = \prod_{r>0} I_r$, respectively.
